

Problem 1**Problem 2****Problem 3****Problem 5****a.)**

We are given the matrix:

$$\begin{bmatrix} 1 & 1 & -1 & 3 \\ 1 & 2 & -4 & -2 \\ 2 & 1 & 1 & 5 \\ -1 & 0 & -2 & -4 \end{bmatrix}$$

The inverse, \mathbf{A}^{-1} of a square matrix, \mathbf{A} , is equal to the adjugate of the matrix, \mathbf{A}^\dagger divided by the determinant of \mathbf{A} .

$$\mathbf{A}^{-1} = \frac{\mathbf{A}^\dagger}{\det \mathbf{A}}$$

The adjugate of a square matrix, \mathbf{A}^\dagger , is the transpose of the cofactor matrix, $\mathbf{C}_\mathbf{A}$.

$$\mathbf{A}^\dagger = \mathbf{C}_\mathbf{A}^T$$

The cofactor of a square matrix, $\mathbf{C}_\mathbf{A}$ is the signed matrix of minors, $\mathbf{M}_\mathbf{A}$.

$$\mathbf{C}_{\mathbf{A},ij} = (-1)^{i+j} \mathbf{M}_\mathbf{A}$$

The minor of matrix element \mathbf{A}_{ij} is the determinant of submatrix formed with the rows and columns other than i and j .

We can use this all together to find the inverse of \mathbf{A} . The matrix given, however, has a determinant of zero, and so is not invertible.

(see attached Jupyter notebook for full calculations)

b.)

We are given the matrix:

$$\begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix}$$

and we know that the eigenvalue λ and eigenvector \vec{v} obey the rule

$$\begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} \vec{v} = \lambda \vec{v}$$

Equivalently,

$$\left(\begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} - \lambda \mathbb{1} \right) \vec{v} = 0$$

We want the non-trivial solution to this equation, when $\vec{v} \neq \vec{0}$. $\vec{v} = \vec{0}$ when $\left(\begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} - \lambda \mathbb{1} \right)$ is invertible, so we will instead assert that $\left(\begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} - \lambda \mathbb{1} \right)$ is not invertible. By definition, this means

$$\det \left(\begin{bmatrix} 3 & -1 \\ -1 & 3 \end{bmatrix} - \lambda \mathbb{1} \right) = 0$$

or

$$\det \begin{bmatrix} 3 - \lambda & -1 \\ -1 & 3 - \lambda \end{bmatrix} = 0$$

We can solve this now for lambda:

$$\begin{aligned} (3 - \lambda)^2 - (-1)^2 &= 0 \\ 9 - 6\lambda + \lambda^2 - 1 &= 0 \\ 8 - 6\lambda + \lambda^2 &= 0 \end{aligned}$$

and using the quadratic formula we find

$$\begin{aligned} \lambda &= \frac{-(-6) \pm \sqrt{(-6)^2 - 4(8)}}{2} \\ \lambda &= \frac{6 \pm \sqrt{36 - 32}}{2} \\ \lambda &= \frac{6 \pm 2}{2} \\ \lambda &= 3 \pm 1 \end{aligned}$$

$$\boxed{\lambda = 2, 4}$$

We can use this eigenvalue to solve for \vec{v} .

$$\begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \vec{v} = 0 \quad \text{and} \quad \begin{bmatrix} -1 & -1 \\ -1 & -1 \end{bmatrix} \vec{v} = 0$$

This gives the equations

$$\lambda = 2 : \begin{cases} v_1 - v_2 = 0 \\ v_2 - v_1 = 0 \end{cases} \quad \lambda = 4 : \begin{cases} -v_1 - v_2 = 0 \end{cases}$$

For $\boxed{\lambda = 2, \vec{v} = \begin{bmatrix} v_0 \\ v_0 \end{bmatrix}}$, and for $\boxed{\lambda = 4, \vec{v} = \begin{bmatrix} v_0 \\ -v_0 \end{bmatrix}}$.

Problem 5

In problem 4 we stated that the inverse, \mathbf{A}^{-1} , of a square matrix, \mathbf{A} , is equal to the adjugate of the matrix, \mathbf{A}^\dagger divided by the determinant of \mathbf{A} .

$$\mathbf{A}^{-1} = \frac{\mathbf{A}^\dagger}{\det \mathbf{A}}$$

We can manipulate this expression to find

$$(\det \mathbf{A})\mathbb{1} = \mathbf{A}^\dagger \mathbf{A}$$

Since we are looking for a self-adjugate matrix, $\mathbf{A}^\dagger = \mathbf{A}$, and

$$(\det \mathbf{A})\mathbb{1} = \mathbf{A}^2.$$

Then, taking the square root of both sides,

$$(\sqrt{\det \mathbf{A}})\mathbb{1} = \mathbf{A}.$$

$$\mathbf{A} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} = \begin{bmatrix} \sqrt{\det \mathbf{A}} & 0 & 0 \\ 0 & \sqrt{\det \mathbf{A}} & 0 \\ 0 & 0 & \sqrt{\det \mathbf{A}} \end{bmatrix}.$$

$$a = e = i = \sqrt{\det \mathbf{A}}$$

$$\mathbf{A} = \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & a \end{bmatrix} =$$

and

$$\det \mathbf{A} = a \begin{vmatrix} a & 0 \\ 0 & a \end{vmatrix}$$

$$\det \mathbf{A} = a(a^2)$$

$$\det \mathbf{A} = a^3.$$

We know that $a = \sqrt{\det \mathbf{A}}$, so

$$a = \sqrt{a^3}$$

$$a = a^{\frac{3}{2}}$$

$$a = 1$$

$$\boxed{\mathbf{A} = \mathbb{1}}$$

We can furthermore use the functions defined in the previous problem to show that \mathbf{A} and \mathbf{A}^\dagger are equal when found through the cofactor method.
